Decode the chart

Name: B. Jahnvi

Rig. no: 192325043

Q. NO: 8.

1. Regional Comparison

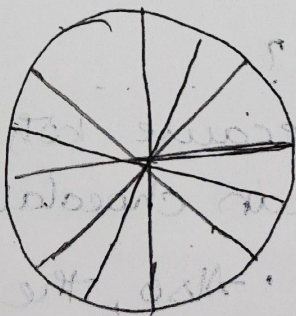

i) What is it trying to tell you?

It is showing the sales in 4 different regions. Nagapur has the highest sales, while Kochi has the lowest.

ii) Do you trust it? Why or why not?

No, the difference between the regions looks much bigger because the y-axis starts at 490 instead of 0. So the chart makes the differences look more dramatic than they actually are.

2. Market share by product (10 categories)

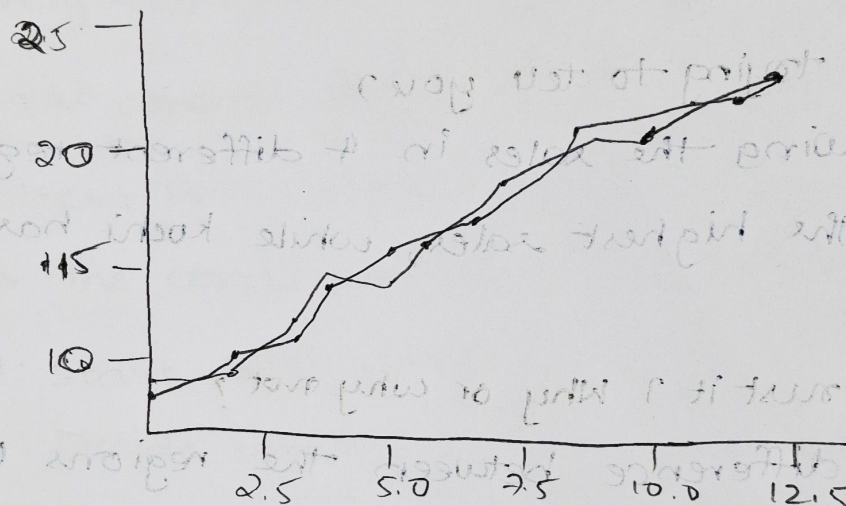

i) What is it trying to tell you?

It shows how the total market share is dividing among 10 different categories. Some products have a much bigger share than others.

ii) Do you trust it? Why or why not?

No, because it is difficult to tell the exact market share. Because there is no percentages or labels for the products within 10 slices. There will be difficulty to find the smaller portion.

3. Chocolate Consumption vs. Nobel prize won.

i) What it is trying to tell you?

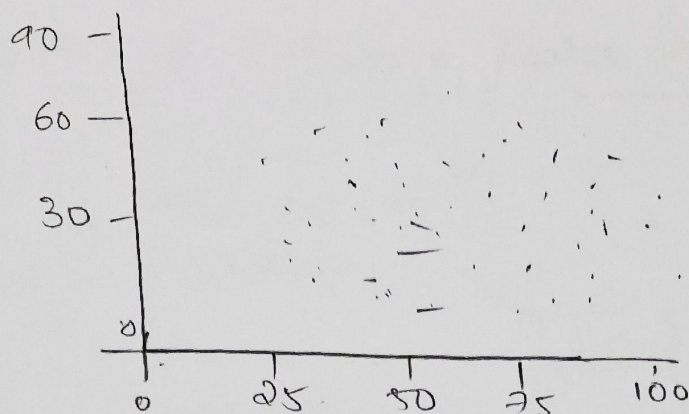

It shows that chocolate consumption & the no. of nobel prizes won both increase over time.

The 2 lines move in a similar direction.

ii) Do you trust it? Why or why not?

I would be careful with it. Just Because both numbers increase together, doesnot mean chocolate Consumption causes more nobel prize. Also, the chart uses 2 different y-axis, which can make the relationship look stronger than it really is.

4 Advertising spend (£s) vs Sales Revenue (£s)

i) What is it trying to tell you?

It shows the relationship b/w advertising spending & sales revenue. The points are spread out across the graph.

ii) Do you trust it? Why or Why not?

There doesn't seem to be a very clear relationship b/w advertising spending & sales.

The points are quite scattered, so we can't say that spending more on advertising automatically leads to higher sales.
